# Recombinant Human HGFR/c-MET Protein (Fc Tag)

Catalog No. PKSH032536

Note: Centrifuge before opening to ensure complete recovery of vial contents.

#### **Description**

Synonyms Hepatocyte growth factor receptor;HGF/sF receptor;Proto-oncogene

c-Met;Scatter factor receptor;SF receptor;Tyrosine-protein kinase Met;MET

Species Human

**Expression Host** HEK293 Cells **Sequence** Glu25-Thr932

Accession P08581 Calculated Molecular Weight 128.4 kDa

Observed molecular weight 170&100-130&45-50 kDa

Tag C-Fc

**Bioactivity** Not validated for activity

#### **Properties**

**Purity** > 95 % as determined by reducing SDS-PAGE.

**Endotoxin** < 1.0 EU per μg of the protein as determined by the LAL method.

**Storage** Generally, lyophilized proteins are stable for up to 12 months when stored at -20 to

-80°C. Reconstituted protein solution can be stored at 4-8°C for 2-7 days. Aliquots

of reconstituted samples are stable at < -20°C for 3 months.

**Shipping** This product is provided as lyophilized powder which is shipped with ice packs.

**Formulation** Lyophilized from a 0.2 µm filtered solution of PBS, pH 7.4.

Normally 5 % - 8 % trehalose, mannitol and 0.01% Tween80 are added as

protectants before lyophilization.

Please refer to the specific buffer information in the printed manual.

**Reconstitution** Please refer to the printed manual for detailed information.

# Data

> 95 % as determined by reducing SDS-PAGE.

## **Background**

Hepatocyte growth factor receptor (HGF R) is a glycosylated receptor tyrosine kinase that plays a central role in epithelial

morphogenesis and cancer development. HGF R is synthesized as a single chain precursor which undergoes cotranslational proteolytic cleavage. Mature HGF R is a disulfide-linked dimer composed of a 50 kDa extracellular  $\alpha$ chain and a 145 kDa transmembrane β chain. Proteolysis and alternate splicing generate additional forms of human HGF R which either lack of the kinase domain; consist of secreted extracellular domains; or are deficient in proteolytic separation of the  $\alpha$  and  $\beta$  chains. The sema domain; which is formed by both  $\alpha$  and  $\beta$  chains of HGF R; mediates both ligand binding and receptor dimerization. HGF stimulation induces HGF R downregulation via internalization and proteasomedependent degradation. Paracrine induction of epithelial cell scattering and branching tubulogenesis results from the stimulation of HGF R on undifferentiated epithelium by HGF released from neighboring mesenchymal cells.
