Background

The tetrameric receptor complex for IFN γ consists of two subunits, IFNGR1 (IFN γ R α) and IFNGR2 (IFN γ R β), through which the dimeric IFN- γ exerts its biological functions, including antiviral, antiproliferation and immune-modulatory activity in mammals. Both IFNGR1 and IFNGR2 are single transmembrane proteins belonging to the class II cytokine family. FNCR1, widely expressed in most host cells, is essential for IFN γ binding, receptor trafficking, and signal transduction. IFNGR1 possesses an intracellular Janus tyrosine kinase (JAK) 1 binding site, a signal transducer and activator of transcription 1 (STAT1) binding site. The resulting STAT1 homodimers translocate from the cytoplasm to the
