## Background

Tumor necrosis factor alpha (TNF $\alpha$ ) is the prototypic ligand of the TNF superfamily. TNF $\alpha$  forms a homotrimer and functions by activating two types of receptors TNF-R1 (TNF receptor type 1, p55R) and TNF-R2 (TNF receptor type 2, p75R). TNF $\alpha$  is a pleiotropic cytokine that is capable to promote inflammation, to induce apoptotic cell death, and to inhibit tumorigenesis and viral replication. TNF $\alpha$  is a potent lymphoid factor that exerts cytotoxic effects on a wide range of tumor cells and certain other target cells.
